Matching
Endpoint graphs + matching rules
Grow one fragment
Keep one compatible assignment
Complete at saturation
Distinct placements; symmetry stays compressed
Conditional search
Commit placements; vary seeds and cuts
Final family catalogue
Group fragment pairs; share repeated families
Next fragment
Separate post-processing
Unique fragments
Collect all family and boundary references
Local bond responses
Decode internal bonds and fragment boundaries
Joint event choices
Compose responses under the saved constraints
Reference verification
Does the retained output include the annotation?
